

# Electric Van Hybrid Power Charging Station

This unique hybrid charging station is one of two designed, built and commissioned by Energy Solutions special projects team. The unit uses solar to charge a sophisticated battery bank which in turn provides the power for the client to recharge their fleet of electric vans. The location of the units required them to be sturdy and easy to maintain by the client's own staff. The Energy Solutions Service team worked on site alongside the client to ensure the correct installation and to provide the final commissioning. During this period the local staff were trained in the operation and maintenance of the system.

## Case Study
